Events during the trials:

The first event was that the participant complained about the test description. He didn't understand which key he had to press (at the post-attentive processing test). After a short verbal explanation this problem was solved. It would have been helpful to mention the two characters of the post-attentive processing test already in the test description.

Additionally, another participant acknowledged that the shown test description was difficult to read because the text itself was too long, there were no blank lines and the line spacing was too small. A better formatting would ensure a better readability.

No further problems occurred.
